

READY TO WORK WHEN YOU ARE !!

Two cutting edge developments of our SLIDE-LOCK SERIES fork mounted models are:

1. We eliminated the hook and chain retainer that held the boom onto the carriage. The hook and chain method has been the result of many accidents. This has been replaced with a patented secure locking system that is installed using no tools called (RigReady Slide-Lock Plate). (The Slide-Lock plate is used with the forks on the forklift.)
2. Notice on our light duty models we have developed another patented plate called the (RigReady Converta-Plate) that bolts to the rear of the boom to attach the boom to the carriage of the forklift and enables the operator of the forklift to use the boom with his forks on or use the boom without the forks on the forklift. Without the forks on the forklift and the boom mounted directly to the carriage it enables the operator to get closer to the machine to lift heavier capacity loads. It also keeps the forks from sticking out the end of the pockets and away from the ground man's head making it safer for the machine hookup. Converta-Plate is an available option of all our fork mounted booms.
